

VC_COUNT

Overview

VC_COUNT represents the counter module. This is very useful infrastructure component for building verification environments. Access task allow counter reset, as well as switching the counting on and off.

Syntax

```
vc_count InstName (clk, rst_n);
```

Interface		
clk		Clock
rst_n		Active-low reset
Access Tasks		
Name	Arguments	Description
reset	No	Resets counter, setting counter value to 0
on	No	Enables the counter incrementing function <u>Example:</u> count.on;
off	No	Disables the counter incrementing function <u>Example:</u> count.off;
Access Registers		
val		The counter value

Example

```
module test;

reg clk, rst_n;
initial begin
    clk = 1;
    rst_n = 0;
end
always #5 clk <= ~clk;
vc_count count (clk, rst_n);
initial begin
    #20 rst_n = 1;
    #30 count.on;
    #40 $display("[%0t] count = %0d", $time, count.val);
    #30 count.off;
    #50 count.on;
    #20 $display("[%0t] count = %0d", $time, count.val);
    #50 count.reset;
    $display("[%0t] count = %0d", $time, count.val);
    #50 $finish;
end
endmodule
```
